Download

JD Unrar

This addon comes by default with JDownloader. JDUnrar is a wrapper for the [W unrar](#) freeware. It enables JDownloader to extract archives automatically after download.

Configuration

General

Unrar command

For most systems, the binaries come with jd. Only if no running binaries are found, this option is available.

Path to unrar binaries.

Linux

For Linux, you jave to install "unrar-nonfree". The correct path to enter then is "/usr/bin/unrar"

Good to know:
The bundled unrar version for linux can be found at %JD_HOME%\tools\linux

MAC

Download "rar" and copy the rar folder in "/usr/bin/" and add the path to jdownloader plugin: "/usr/bin/unrar". By default, this folder is not visible. To solve this, copy the rar folder to the root (Macintosh HD) and execute the following unix command: Enter in Terminal:

```
sudo cp /rar/rar /usr/bin/rar sudo cp /rar/unrar /usr/bin/unrar
```

or open the finder →menu →„Go to" →„Go to folder" (Command +Shift +G) → enter "/user/bin"

Use customized extract path

Check this option if you want to use an extract path that is different from the downloadpath. Enter your wished path below. You can use these variables

Delete archives after successfull extraction

Delete archivefiles (*.rar,..) after the extraction finished successfully.

Overwrite existing files

Check this option if existings files should be overwritten by the extract process.

List of passwords

JDUnrar remembers every password you have pre-entered and every password the linkgrabber detects. Once a password is in this list, you will never have to enter it again. JD will search the list for correct passwords and use them.

The longer this list, the longer this "search process" may take. JD autosorts the list, to optimize the process.

Advanced

Use subpath

JDUnrar can create subpaths for each archiv.

Subpath

To set up your subpath, you may use different variables

Only use subpath if archive contains more than * files

Sometimes, you might be interested in creating a subfolder only if the archiv contains a lot of files. You can define filelimit here.

e.g. if you set it to 5, JDUnrar only creates a subfolder of the archive contains more than 5 files. 0 or -1 to disable.

Ask for unknown passwords

If you did not enter the password when adding the links, and the password is not in the passwordlist, JD is abled to ask you to enter it during extraction.

Deep extraction

Often, there is a rar-archive in a rar-archive in a rar-archive etc. If this option is checked, JD extracts everything until there are no more archives.

Delete Info file after extraction

The addon "Infofile writer" creates *.info files in the downloaddirectory. JDUnrar may remove this infofiles after extraction.

Variables

JDUnrar is able to create dynamic extractpaths. The following variables can be used.

%PACKAGENAME% → name of the filepackage

%ARCHIVENAME% → myarchive.rar →/myarchive/

%HOSTER% → Downloaded from rapidshare.com → /rapidshare.com/

Functions

If enabled, JDUnrar automaticly extracts rar archives after downloading them. This Feature can be disabled in the addon's config menu.

Config menu

Enable

enables or disabled the autoextraction

Extract Archive(s)

Opens archives from HD to extract. Useful to use the password search for all files.
